

# Lec03: Integer overflow and Undefined Behavior

*Taesoo Kim*

# Goals and Lessons

- Learn about three classes of vulnerabilities
  1. Integer overflow (undefined behavior)
  2. Race condition
  3. Uninitialized reads
- Understand their security implications
- Understand best security practices
- Learn them from the real-world examples (Android, Linux, etc)

# CS101: Integer Representation

Ref. [https://en.wikipedia.org/wiki/Integer\\_overflow](https://en.wikipedia.org/wiki/Integer_overflow)

# CS101: Two's Complement Representation

The value  $w$  of an  $N$ -bit integer  $a_{N-1}a_{N-2}\dots a_0$

$$w = -a_{N-1}2^{N-1} + \sum_{i=0}^{N-2} a_i 2^i.$$

e.g., in x86 (32-bit, 4-byte):

- 0x00000000 -> 0
- 0x7fffffff -> 2147483648 (INT\_MAX)
- 0x80000000 -> -2147483649 (INT\_MIN)
- 0xffffffff -> -1

Ref. [https://en.wikipedia.org/wiki/Two's\\_complement](https://en.wikipedia.org/wiki/Two's_complement)

# Arithmetic with Two's Complements

- One instruction works for both sign/unsigned integers (i.e., add, sub, mul)
  - e.g., add reg1, reg2 (not distinguishing signedness of reg1/2)
- Properties
  - Non-symmetric representation of range, but single 0
  - MSB represents signedness: 1 means negative, 0 means positive

`0x00000001 + 0x00000002 = 0x00000003` ( `1 + 2 = 3` )

`0xffffffff + 0x00000002 = 0x00000001` ( `-1 + 2 = 1` )

`0xffffffff + 0xffffffffe = 0xffffffffd` ( `-1 + -2 = -3` )

`range(signed integer) = [-231-1, 231] = [-2147483649, 2147483648]`

`range(unsigned integer) = [0, 232-1] = [0, 4294967295]`

# Question!

- Then, how to interpret the arithmetic result?

*; 0xffffffff + 0xffffffe = 0xffffffd (-1 +-2 =-3)*

```
mov eax, 0xffffffff    ; eax = 0xffffffff  
mov ebx, 0xffffffd     ; ebx = 0xffffffe  
add eax, ebx          ; eax = 0xffffffd  
; eax = 0xffffffd  
; 1) is it -3?  
; 2) is it 4294967293 (== 0xffffffd)?
```

# Idea: Using Status Flags (E/RFLAGS)

- CF: overflow of unsigned arithmetic operations
- OF: overflow of signed arithmetic operations

`0x00000001 + 0x00000002 = 0x00000003 ( 1 + 2 = 3)`

`-> CF: 0    OF: 0    SF: 0`

`0xffffffff + 0x00000002 = 0x00000001 (-1 + 2 = 1)`

`-> CF: 1    OF: 0    SF: 0`

`0x80000000 + 0xffffffff = 0x7fffffff (-2147483649 + -1 = 2147483648)`

`-> CF: 1    OF: 1    SF: 0`

`0x7fffffff + 0x00000001 = 0x80000000 ( 2147483648 + 1 = -2147483649)`

`-> CF: 0    OF: 1    SF: 1`

# C's Integer Representation

	x86 (32b)	x86_64 (64b)
char	: 1 bytes	1 bytes
unsigned char	: 1 bytes	1 bytes
short	: 2 bytes	2 bytes
unsigned short	: 2 bytes	2 bytes
int	: 4 bytes	4 bytes
unsigned int	: 4 bytes	4 bytes
(*) long	: 4 bytes	8 bytes
(*) unsigned long	: 4 bytes	8 bytes
long long	: 8 bytes	8 bytes
unsigned long long	: 8 bytes	8 bytes
(*) size_t	: 4 bytes	8 bytes
(*) ssize_t	: 4 bytes	8 bytes
(*) void*	: 4 bytes	8 bytes

# Thinking of C's Type/Precision Conversion

- Lower → higher precision

```
char -> int
[-128, 127] -> [-128, 127]
[0x80, 0x7f] -> [0xffffffff80, 0x0000007f]
-----> sign extended (e.g., movsx)
```

```
unsigned char -> unsigned int
[0, 255] -> [0, 255]
[0, 0xff] -> [0, 0x000000ff]
-----> zero extended (e.g., movzx)
```

# Thinking of C's Type/Precision Conversion

- Higher → lower precision (what's correct mappings?)
- Mathematically complex, but architecturally simple (truncation!)

```
int -> char  
[-2147483649, 2147483648] -> [-128, 127]  
[0x80000000, 0x7fffffff] -> [0x80, 0x7f]
```

```
unsigned int -> unsigned char  
[0, 4294967295] -> [0, 255]  
[0, 0xffffffff] -> [0, 0xff]
```

both simply, `eax -> al` (by processor)

# Example of Precision Conversion

```
$ cd lec03-intovfl/intovfl
$ ./intovfl2
0x7fffffff ->
(unsigned int)(unsigned char): 000000ff
; mov eax, 0x7fffffff
; movzx eax, al
(unsigned int)(char)           : ffffffff
; mov eax, 0xffffffff
; movsx eax, al
```

# Question?

```
char c1 = 100;
```

```
char c2 = 3;
```

```
char c3 = 4;
```

```
c1 = c1 * c2 / c3;
```

-----

1)  $300 / 4 = 75$

2)  $300$  ( $0x12c$ , which is  $> 8$  bytes)  $\rightarrow 0x2c / 4 = 11$

# Basic Concept: Integer Promotion

- Before any arithmetic operations,
- All integer types whose size is  $< \text{sizeof}(\text{int})$ :
  1. Promote to int (if int can represent the whole range)
  2. Promote to unsigned int (if not)

# Example: char/unsigned char Addition

- Promote to int (if int can represent the whole range)

*// by rule 1. -> (1)*

`char` sc = SCHAR\_MAX;

`unsigned char` uc = UCHAR\_MAX;

`long long` sll = sc + uc;

1) `(unsigned long long)((int)sc + (int)uc)?`

2) `(unsigned long long)sc + (unsigned long long)uc?`

# Example: int/unsigned int Comparison

- Promote to unsigned int (if not)

```
// by rule 2. -> (2)
```

```
int si = -1;
```

```
unsigned int ui = 1;
```

```
printf("%d\n", (int)(si < ui));
```

```
1) ui promotes to int
```

```
   = -1 < 1
```

```
   = 1
```

```
2) si promotes to unsigned int
```

```
   = 0xffffffff < 1
```

```
   = 0
```

# Remark: Undefined Behaviors

- Overflow of unsigned integers are well-defined (i.e., wrapping)
- Overflow of **signed** integers are **undefined**
  - But well-defined to the processor (i.e., wrapping in x86)
  - Optimization takes advantages of this, making it hard to understand

# CS101: Int. Ovfl. and Undefined Behavior

1. (in x86\_64) what does the expression `1 > 0` evaluate to?
- (a) `0`    (b) `1`    (c) NaN    (d) `-1`    (e) undefined

# CS101: Int. Ovfl. and Undefined Behavior

2. `(unsigned short)1 > -1?`

- (a) 1    (b) 0    (c) -1    (d) undefined

# CS101: Int. Ovfl. and Undefined Behavior

3.  $-1U > 0$ ?

- (a) 1      (b) 0      (c) -1      (d) undefined

# CS101: Int. Ovfl. and Undefined Behavior

4. `UINT_MAX + 1`?

- (a) `0`    (b) `1`    (c) `INT_MAX`    (d) `UINT_MAX`    (e) `undefined`

# CS101: Int. Ovfl. and Undefined Behavior

5. `abs(-2147483648)`, `abs(INT_MIN)`?  
(a) 0 (b) < 0 (c) > 0 (d) NaN

# CS101: Int. Ovfl. and Undefined Behavior

6.  $1U \ll 0$ ?

- (a) 1    (b) 4    (c) `UINT_MAX`    (d) 0    (e) undefined

# CS101: Int. Ovfl. and Undefined Behavior

7.  $1U \ll 32$ ?

- (a) 1    (b) 4    (c) `UINT_MAX`    (d) `INT_MIN`    (e) 0    (f) undefined

# CS101: Int. Ovfl. and Undefined Behavior

8.  $-1L \ll 2$ ?

- (a) 0    (b) 4    (c) INT\_MAX    (d) INT\_MIN    (e) undefined

# CS101: Int. Ovfl. and Undefined Behavior

9. `INT_MAX + 1`?

- (a) `0`    (b) `1`    (c) `INT_MAX`    (d) `UINT_MAX`    (e) `undefined`

# CS101: Int. Ovfl. and Undefined Behavior

10. `UINT_MAX + 1`?

- (a) `0`    (b) `1`    (c) `INT_MAX`    (d) `UINT_MAX`    (e) undefined

# CS101: Int. Ovfl. and Undefined Behavior

11. -INT\_MIN?

- (a) 0    (b) 1    (c) INT\_MAX    (d) UINT\_MAX    (e) INT\_MIN  
(f) undefined

# CS101: Int. Ovfl. and Undefined Behavior

12.  $-1_L > 1_U$ ? on x86\_64 and x86

- (a)  $(0, 0)$  (b)  $(1, 1)$  (c)  $(0, 1)$  (d)  $(1, 0)$   
(e) undefined

# CS101: Int. Ovfl. and Undefined Behavior

BONUS. is it possible that  $a / b < 0$  when  $a < 0$  and  $b < 0$ ?

# Integer-related Vulnerabilities

1. Precision (or widthness) overflows
2. Arithmetic overflows
3. Signedness bugs
4. Undefined behaviors (e.g., time bomb)

# 1. Precision Error: CVE-2015-1593

- Arithmetic operations b/w unsigned int and unsigned long
- Reducing ASLR entropy by four in Linux (in x86\_64)

```
1 // @fs/binfmt_elf.c
2 static unsigned long randomize_stack_top(unsigned long stack
3     unsigned int random_variable = 0;
4     if ((current->flags & PF_RANDOMIZE) &&
5         !(current->personality & ADDR_NO_RANDOMIZE)) {
6         random_variable = get_random_int() & STACK_RND_MASK;
7     * random_variable <= PAGE_SHIFT;
8     }
9     return PAGE_ALIGN(stack_top) - random_variable;
10 }
```

# CVE-2015-1593: Patch

- unsigned int → unsigned long (match the precision)
- Be careful when you'd like to multiple architecture

```
1 // @fs/binfmt_elf.c
2 static unsigned long randomize_stack_top(unsigned long stack
3 * unsigned long random_variable = 0;
4     if ((current->flags & PF_RANDOMIZE) &&
5         !(current->personality & ADDR_NO_RANDOMIZE)) {
6         random_variable = get_random_int() & STACK_RND_MASK;
7     * random_variable <= PAGE_SHIFT;
8     }
9     return PAGE_ALIGN(stack_top) - random_variable;
10 }
```

## 2. Arithmetic Overflow: CVE-2018-6092

- Arithmetic overflows when adding two unsigned ints
- Result in *remote* code execution in Chrome (V8/WASM, 32-bit)

```
1  // @src/wasm/function-body-decoder-impl.h
2  //  count: unsigned int
3  //  type_list->size(): size_t
4  //  kV8MaxWasmFunctionLocals: size_t
5
6  * if ((count + type_list->size())
7  *     > kV8MaxWasmFunctionLocals) {
8      decoder->error(decoder->pc()-1, "local count too large")
9      return false;
10 }
```

# CVE-2018-6092: Patch

- Standard pattern/fix
- Avoid potential arithmetic overflows

```
1  // @src/wasm/function-body-decoder-impl.h
2  //  count: unsigned int
3  //  type_list->size(): size_t
4  //  kV8MaxWasmFunctionLocals: size_t
5
6  + DCHECK_LE(type_list->size(), kV8MaxWasmFunctionLocals);
7  + if (count
8  +     > kV8MaxWasmFunctionLocals - type_list->size()) {
9      decoder->error(decoder->pc()-1, "local count too large")
10     return false;
11 }
```

## 3. Signedness Bugs: CVE-2017-7308

- Casting the arithmetic result of unsigned ints to sign for comparison
- Result in *remote* code execution in Linux (network stack)

```
1 // @net/packet/af_packet.c
2 //   req->tp_block_size: unsigned int
3 //   BLK_PLUS_PRIV(..) : unsigned int
4
5 if (po->tp_version >= TPACKET_V3 &&
6     * (int)(req->tp_block_size -
7           BLK_PLUS_PRIV(req_u->req3.tp_sizeof_priv)) <= 0)
8     goto out;
```

# CVE-2017-7308: Patch

- Direct comparison of unsigned ints!
- Fix a potential overflow inside the macro as well

```
1 // @net/packet/af_packet.c
2 //   req->tp_block_size: unsigned int
3 //   BLK_PLUS_PRIV(..) : unsigned long long
4
5 if (po->tp_version >= TPACKET_V3 &&
6     *   req->tp_block_size
7     *   <= BLK_PLUS_PRIV((u64)req_u->req3.tp_sizeof_priv))
8     goto out;
```

# Testing Signedness Bugs

```
$ cd lec03-intovfl/intovfl
$ make
$ ./uintcmp
0 < 1 = 1?
(int)(0 - 1) == -1 <= 0? -> 1
1 < 0 = 0?
(int)(1 - 0) == 1 <= 0? -> 0
4294967196 < 200 = 1?
(int)(4294967196 - 200) == -300 <= 0? -> 1
unsigned int a = ?
unsigned int b = ?
```

## 4. Undefined Behaviors: NaCL/x86

- Shifting more than the available #bits
- Result in the entire sandbox sequence no-op!

```
// @NaClSandboxAddr()
```

```

                                +--> 32 bytes in x32
                                |
                                +-----
return addr & ~(uintptr_t)((1 << nap->align_boundary) - 1);
                                +-----
                                |
                                +--> (1 << 32) == 1 in gcc!
```

Ref. <https://bugs.chromium.org/p/nativeclient/issues/detail?id=245>

# Secure Way to Add Two Ints

- [SEI CERT C Coding Standard](#)

```
void func(signed int si_a, signed int si_b) {  
    signed int sum = si_a + si_b;  
    /* ... */  
}
```

# Secure Way to Add Two Ints

```
1  #include <limits.h>
2
3  void f(signed int si_a, signed int si_b) {
4      signed int sum;
5      if (((si_b > 0) && (si_a > (INT_MAX - si_b))) ||
6          ((si_b < 0) && (si_a < (INT_MIN - si_b)))) {
7          /* Handle error */
8      } else {
9          sum = si_a + si_b;
10     }
11     /* ... */
12 }
```

# Secure Way to Multiplying Two Ints

```
void func(signed int si_a, signed int si_b) {  
    signed int result = si_a * si_b;  
    /* ... */  
}
```

# Secure Way to Multiplying Two Ints

```
1 void func(signed int si_a, signed int si_b) {
2     signed int result;
3     signed long long tmp;
4
5     tmp = (signed long long)si_a * (signed long long)si_b;
6
7     /* If the product cannot be represented as a 32-bit integer
8     handle as an error condition. */
9     if ((tmp > INT_MAX) || (tmp < INT_MIN)) {
10         /* Handle error */
11     } else {
12         result = (int)tmp;
13     }
14     /* ... */
15 }
```

# Secure Way to Multiplying Two Ints

The following portable compliant solution can be used with any conforming implementation, including those that do not have an integer type that is at least twice the precision of `int`:

```
#include <limits.h>

void func(signed int si_a, signed int si_b) {
    signed int result;
    if (si_a > 0) { /* si_a is positive */
        if (si_b > 0) { /* si_a and si_b are positive */
            if (si_a > (INT_MAX / si_b)) {
                /* Handle error */
            }
        } else { /* si_a positive, si_b nonpositive */
            if (si_b < (INT_MIN / si_a)) {
                /* Handle error */
            }
        } /* si_a positive, si_b nonpositive */
    } else { /* si_a is nonpositive */
        if (si_b > 0) { /* si_a is nonpositive, si_b is positive */
            if (si_a < (INT_MIN / si_b)) {
                /* Handle error */
            }
        } else { /* si_a and si_b are nonpositive */
            if ( (si_a != 0) && (si_b < (INT_MAX / si_a))) {
                /* Handle error */
            }
        } /* End if si_a and si_b are nonpositive */
    } /* End if si_a is nonpositive */

    result = si_a * si_b;
}
```

# Case Study: Chackra Core (Multiplying Ints)

```
1  // Returns true if we overflowed, false if we didn't
2  bool Int64Math::Mul(int64 left, int64 right, int64 *pResult)
3  #if defined(_M_X64)
4      // (I)MUL (Q/64) R[D/A]X <- RAX * r/m64
5      int64 high;
6      *pResult = _mul128(left, right, &high);
7      return ((*pResult > 0) && high != 0) \
8              || ((*pResult < 0) && (high != -1));
9  #else
10     *pResult = left * right;
11     return (left != 0 && right != 0 \
12            && (*pResult / left) != right);
13 #endif
14 }
```

# Case Study: glibc (Multiplying UInts)

```
1  static inline bool
2  check_mul_overflow_size_t(size_t left, size_t right,
3                             size_t *result) {
4      /* size_t is unsigned
5       so the behavior on overflow is defined. */
6      *result = left * right;
7      size_t half_size_t \
8          = ((size_t) 1) << (8 * sizeof (size_t) / 2);
9
10     if ((left | right) >= half_size_t) {
11         if (right != 0 && *result / right != left)
12             return true;
13     }
14     return false;
15 }
```

# New Proposals: `__builtin*_overflow()`

- Ref. <https://gcc.gnu.org/onlinedocs/gcc/Integer-Overflow-Builtins.html>

```
bool __builtin_add_overflow (type1 a, type2 b, type3 *res);
```

```
bool __builtin_sub_overflow (type1 a, type2 b, type3 *res);
```

```
bool __builtin_mul_overflow (type1 a, type2 b, type3 *res);
```

```
bool __builtin_uadd_overflow (unsigned int a, unsigned int b,  
                             unsigned int *res);
```

```
...
```

## Example: New calloc()

```
1 void * calloc (size_t x, size_t y) {  
2     size_t sz;  
3     if (__builtin_mul_overflow (x, y, &sz))  
4         return NULL;  
5     void *ret = malloc (sz);  
6     if (ret)  
7         memset (ret, 0, sz);  
8     return ret;  
9 }
```

# Integer Overflow Beyond Security

- 1996: Ariane 5 rocket crashed
- 2015: FAA requested to reset Boeing 787 every 248 days
- 2016: a Casino machine printed a prize ticket of \$42,949,672!

# Not Abusing Int-related BU in Optimizer

- Option: -fwrapv (gcc/clang)

```
1 // $ cd lec03-intovfl/intovfl
2 // $ make check-fwrapv
3
4 int base;
5 scanf("%d", &base);
6
7 // Q. base = INT_MAX?
8 if (base < base + 1)
9     printf("base < base + 1 is true!\n");
```

# Exercise: Real-world Examples

- Ex1. Android Stagefright (CVE-2015-1538, CVE-2015-3824)
- Ex2. Linux Keyring (CVE-2016-0728)

# CVE-2015-1538: Android (Stagefright)

```
1 // @edd4a76eb4747bd19ed122df46fa46b452c12a0d
2 // CVE-2015-1538
3     mTimeToSampleCount = U32_AT(&header[4]);
4 +     uint64_t allocSize = mTimeToSampleCount * 2 * sizeof(ui
5 +     if (allocSize > SIZE_MAX) {
6 +         return ERROR_OUT_OF_RANGE;
7 +     }
8     mTimeToSample = new uint32_t[mTimeToSampleCount * 2];
```

# CVE-2015-3824: Android (Stagefright)

```
1 // @463a6f807e187828442949d1924e143cf07778c6
2 // CVE-2015-3824
3 -   uint8_t *buffer = new (std::nothrow) uint8_t[size + chu
4 +   if (SIZE_MAX - chunk_size <= size) {
5 +       return ERROR_MALFORMED;
6 +   }
7 +
8 +   uint8_t *buffer = new uint8_t[size + chunk_size];
```

# CVE-2016-0728: Linux Keyring

```
1  long join_session_keyring(const char *name) {
2      // refcnt is incremented on "success"!
3      keyring = find_keyring_by_name(name, false);
4      if (PTR_ERR(keyring) == -ENOKEY) { ... }
5      else if (IS_ERR(keyring)) { ... }
6      } else if (keyring == new->session_keyring) {
7          ret = 0;
8          goto error2;
